

Catalyst Announces Purpose-Built E-Discovery Platform for General Counsel

Catalyst, a developer of e-discovery solutions, has introduced Insight Enterprise, a platform the company says is specifically designed for corporate general counsel to centralize, simplify and reduce the cost of e-discovery across all their litigation, investigation and compliance matters and teams.

The company's news release continues:

Insight Enterprise enables corporate legal departments to centralize e-discovery management and data, simplify management through streamlined business processes, and reduce the total cost of discovery through efficiencies far greater than just the cost per gigabyte.

"Cost concerns are driving legal departments to shift more work in-house, exercise tighter management over outside legal matters, and expect more precise reporting and accountability from their legal teams," said John Tredennick, Catalyst's founder and CEO. "Until now, however, general counsel have not had a platform specifically designed for corporate e-discovery. Insight Enterprise gives them the centralization, automation and reporting they need to most effectively manage their legal matters."

According to a recent Gartner report, in addition to cost pressures, rapid data growth is also forcing GCs to grapple with greater security challenges and compliance risks. These concerns are causing many organizations to carefully re-examine their e-discovery practices and technology.

Insight Enterprise: A Better Way to Reduce Litigation Cost

Designed specifically for corporate legal departments, Insight Enterprise reduces corporate legal costs through:

- Automation from processing through production.
- Centrally managed data hubs capable of handling millions of documents across multiple matters.
- Coding consistency across cases and counsel.
- Customized tracking and financial reporting within and across matters.
- Airtight security with multi-level access controls.

Insight Enterprise allows documents to be loaded and processed once in a central repository. They can then be assigned to multiple matters with synchronized review tags to reduce review costs and the risk of inconsistent coding. Additionally, consistent workflows and best practices minimize cost and mistakes by making the process more efficient and predictable.

“Corporate legal professionals are under increasing pressure to stay on top of their cases and ensure matters are progressing as efficiently as possible,” said Tredennick. “Our goal in all of this is really very simple – enable our clients to reduce discovery costs and provide predictability through a central, secure e-discovery platform that they can control from beginning to end.”
