Does EPA’s Clean Power Plan Threaten Reliability?

Advanced Energy Economy presents a free on-demand webinar discussing how advanced energy technologies can be utilized by grid operators to safeguard reliability as states modernize their electric power systems under the Clean Power Plan.

The North American Electricity Reliability Corporation (NERC) issued a report in November that raised questions about the potential impact of EPA’s Clean Power Plan (CPP) on the reliability of the electric system, AEE says on its website.

In this technical review of the NERC report commissioned by the Advanced Energy Economy Institute (AEEI), the Brattle Group explores the technology, operational, and market options that will allow states and power system operators to meet CPP requirements without compromising reliability.

Watch the on-demand webinar.
