White Paper: Electronic Signature Security & Trust

eSignLive by Vasco has made available for downloading a new white paper that discusses the best security practices for implementing e-signatures and evaluating vendors. ***(See the download form below.)***

"It is important to make sure your electronic signature provider meets the highest security standards. Security is at the core of a trusted digital experience between you, your employees and customers," the company says on its website.

That means more than simply passing an audit. eSignLive recommends taking a broader view of e-signature security that also addresses:

- Choosing the appropriate level of authentication
- Protecting signatures and documents from tampering
- Making it easy to verify e-signed records
- Ensuring vendor-independent records
- Verifying the vendor has a consistent track record of protecting customer data
- Creating end-to-end trust through white-labeling and integration with your existing IAM framework

The white paper includes a best practices checklist.
