FTI Technology Launches Radiance Software Platform

Global business advisory firm **FTI Consulting, Inc.** has announced the launch of **Radiance**, a new visual analytics software platform designed to enable organizations to dynamically investigate and understand their enterprise data. Developed by FTI Consulting's Technology segment, Radiance is now available either as a cloud-based service or as a rapid deployment mobile option.

"Mission-critical information resides across disparate systems, from legacy applications inside the corporate firewall to third-party cloud software, and this data can make or break an investigation or legal matter," said Eddie O'Brien, Senior Managing Director in the Technology segment at FTI Consulting and primary inventor of Radiance. "Organizations need an easy-to-use, scalable platform that connects with their data and enables users to iteratively investigate and quickly act upon the information. Radiance delivers against this need with speed and visual analytics that help users rapidly identify key custodians, date ranges and document types during early case assessment ("ECA") or an investigation to determine the social network, communication pattern and information shared by key custodians."
