Grid Modernization: Asset Management

ABB will present a free webinar on electric grid asset management techniques. The webinar will be Tuesday, Sept. 30, beginning at 11 a.m. Eastern time.

Transitioning from costly asset time-based maintenance to condition- based maintenance has been a long term goal of many utility organizations, ABB says on its website. The difficulty lies in the creation of a solution that can interpret SCADA data, historical data and other back office data to model an asset's behavior with the ability to:

- Prioritize maintenance tasks
- Compare asset performance to maintenance activities… and
- Identify the criticality of an asset

ABB says this webinar will help participants discover how to construct a solution, which data is needed, and the skill sets required.

Register for the webinar.
