What Contract Risks are Hiding in the Cloud?

The International Association for Contract & Commercial Management and Iron Mountain offer a complimentary on-demand webinar covering the best ways to manage risk with both licensed software and SaaS applications and data.

“Eight out of every 10 new applications are being built for the cloud,” IACCM says on its website.” So, as your organization moves forward with contracting, how can you ensure that your applications and data are protected? Unlike on-premises software, your application and data both reside in the cloud. If something happens to your provider, you need to be prepared.”

Attendees will uncover answers to questions such as:
– What can I do proactively to safeguard my company in case something happens to my SaaS provider?
– How can I mitigate the risk of data loss?
– Are there templates/process documents I can use to evaluate my risk?
– Which terms and conditions should I include in my contracts?
– What are the best practices to safeguard SaaS applications and data?

Watch the on-demand webinar.
