iCONECT-XERA Adds Integrated Analytics Including Predictive Review

iCONECT, developers of XERA e-discovery software, announced that all XERA licenses now will include XERA's full suite of analytic tools, including: predictive coding, workflow, iCONECT's XMPLAR, near-duplication, conceptual search, email threading and iVIEW cluster visualization.

"Allowing clients to use analytics on an unlimited amount of data, across all users and on all projects — without the additional per-gigabyte charges of other review products — provides much needed predictability to project budgets," the company said in a release.

"The ability to include analytics, specifically predictive review with every project will mean real savings for our clients," says Gavin W. Manes, Ph.D., Chief Executive Officer of Avansic, an iCONECT hosting partner. "iCONECT continues to add value to the XERA platform, and now with near-dupe, threading and predictive review included in licensing, our clients will benefit immensely."
