

# **Ireland's largest Information Security provider, Ward Solutions, turn to Luminance's AI to fulfil DSARs**

3 May 2021- Luminance has announced that Ireland's leading provider of information security and risk management solutions, Ward Solutions, has adopted Luminance's cutting-edge AI platform to assist their in-house legal and data protection team when responding to Data Subject Access Requests (DSARs) arising under the General Data Protection Regulation (GDPR).

Ward Solutions have opted to adopt Luminance's AI-powered eDiscovery solution instead of outsourcing this work to expensive third party providers, allowing Ward to analyse vast datasets in record time and maintain maximum compliance, whilst also reducing overall costs.

Luminance's eDiscovery platform uses a combination of both supervised and unsupervised machine learning to read and form an understanding of the firm's vast dataset. Luminance's ability to automatically identify Personally Identifiable Information (PII) such as party names, security numbers and addresses ensures that Ward Solutions are able to rapidly identify personal information within documents collated in response to a DSAR. By using Luminance's revolutionary bulk redaction feature, the legal team can then isolate all of the relevant information and remove irrelevant data, a process that would be extremely resource and time-intensive to do manually.

Luminance is used in over 300 law firms and organisations across the world. The company was recently recognised as a 'Future Fifty' firm by Tech Nation.
