LNG – Delivering on the Promise of the Shale Gas Boom

The American Society of Mechanical Engineers has posted a complimentary webinar on new Liquefied Natural Gas (LNG) technology.

The ASME says on its website that some experts believe that the U.S. is in the middle of an energy revolution due to advances in the production of natural gas. But up to now, the effects of that revolution has been limited because natural gas is hard to store and transport globally, like oil or distribute as a transport fuel, like gasoline. Now companies are working to build plants in the U.S. that can turn natural gas into a liquid to export and others are developing new LNG dispensing technology for engines to use liquefied natural gas instead of gasoline or diesel.

George Hu, Technology Manager LNG at Technip USA, and Justin Capouch, LNG Technology Manager at CB&I, are presenters for this live webinar about these technologies and how they could deliver American shale gas to the world.

Watch the on-demand webinar.
