# Onna and Zapproved Announce Integration to Transform Legal Hold Management

New York, NY and Portland, OR — 29 June, 2021: Onna and Zapproved have today announced a direct integration between Onna's Knowledge Integration Platform and Zapproved's ZDiscovery platform to create a more seamless legal hold experience than ever before, particularly for unstructured data.

Through this integration, joint Onna and Zapproved customers will be able to automatically preserve Slack data at the point of hold issuance — something that has not been possible until now. Slack legal holds initiated from Zapproved's ZDiscovery Preserve are instantly applied to archived data in Onna, significantly reducing the time and costs associated with preserving Slack data.

Until now, businesses have struggled with a way to deal with legal hold management for unstructured data. Traditionally, preserving Slack data required multiple steps, including notifying custodians from a legal hold platform, followed by a repeated process to identify, collect and hold Slack data from a separate platform. This integration will enable customers to place holds and send out communications seamlessly, starting first with Slack and then expanding to other applications, where a single hold for selected custodians in ZDiscovery Preserve can be automatically applied across multiple data sources in Onna.

Data can be searched, culled, and exported for review at any time, which improves legal self-service by creating less dependence on the IT department. The integration can be set up quickly and easily, and features an intuitive user experience

that allows for rapid time to value.
