The Expanding Business of Nanogrids

Navigant Research presents a free on-demand webinar on the development and deployment of nanogrids on the nation's electrical system.

While microgrids are multiplying rapidly, substantial deployments of nanogrids – defined as systems of 100 kilowatts (kW) for grid-tied systems and 5 kW for remote systems not interconnected with a utility grid – already exist, Navigant says on its website.

Nanogrids offer flexible, modular building blocks for energy services that support applications ranging from emergency power for commercial buildings to the provision of basic electricity services for people living in extreme poverty.
