

The Fracking-Water Nexus: Issues Encountered by Industry

Penn State Extension presents a free on-demand webinar aimed at answering the question: What happens to the water after the fracking process?

Some flows back to the surface and some of this flowback is treated locally and some is transported for injection into deep disposal wells. The program will describe the procedure and explain the physics of the movement of the liquids involved.

Lead presenter is Dr. Terry Engelder, Professor of Geosciences at Penn State University.

Watch the on-demand webinar.
