Unknowns in Methane Emissions from Shale Gas Production

Penn State Extension has posted online a recorded webinar about the current state of knowledge of methane emissions from the production of shale gas and the importance of learning more about the effects of those emissions.

The webinar covers why we care about methane emissions into the atmosphere, including a primer on methane's role in the earth's climate, the current state of knowledge of these emissions, methods used to measure methane emissions from gas production, and the current research to improve our knowledge of methane emissions from gas production activities.

The presenter is Kenneth J. Davis, Professor in the Department of Meteorology and Earth and Environmental Systems Institute at Pennsylvania State University.
